

Capital.com API - Errors, Confirmations & Recovery

Part 6 for CapitalDemoBroker / Codex

Source basis: official Capital.com Public API 1.0.0, accessed 10 Aug 2026. This is a Codex-oriented technical reference; unsupported behavior is explicitly marked as unresolved rather than guessed.

1. Confirmation is mandatory for trade-state certainty

Position and order creation/update/delete operations return a dealReference. For position creation, Capital.com explicitly warns that a successful HTTP response does not necessarily mean the position opened. GET /api/v1/confirm/{dealReference} is the broker confirmation path.

```
GET /api/v1/confirm/{dealReference}
Headers:
CST: REDACTED_CST
X-SECURITY-TOKEN: REDACTED_SECURITY_TOKEN
```

Documented HTTP responses: 200 OK, 404 Not Found

Confirmation data includes operation/trade status information plus affectedDeals. When the order prefix created by position creation is queried, opened position IDs are reported in affectedDeals.

2. Activity status enums useful for Recovery

ACCEPTED
CREATED
EXECUTED
EXPIRED
REJECTED
MODIFIED
MODIFY_REJECT
CANCELLED
CANCEL_REJECT
UNKNOWN

GET /history/activity also exposes source enums CLOSE_OUT, DEALER, SL, SYSTEM, TP, USER and type enums POSITION, WORKING_ORDER, EDIT_STOP_AND_LIMIT, SWAP, SYSTEM.

3. HTTP response classes visible in the public contract

Class	Meaning for adapter
400	Bad Request - do not blindly retry unchanged request
401	Unauthorized - session/authentication problem
404	Requested confirmation/position/order may not be found
429	Too Many Requests - rate limit; do not assume a trading write was not processed
2xx + dealReference	Operation accepted for processing; final broker state still requires confirmation/reconciliation

4. Retry matrix

Event	Action
GET timeout	Bounded retry with rate limiter
401 on read	Re-authenticate then repeat read
Trading write returned dealReference	Query confirmation; never duplicate write
Trading write timed out with no dealReference	AMBIGUOUS_OUTCOME: reconcile positions, working orders, activity/history
Confirmation/activity UNKNOWN	Recovery/manual verification path
404 during reconciliation	Refresh authoritative collections before deciding object never existed
429	Backoff; for writes also verify whether outcome is ambiguous

5. Important unresolved point

The public page does not provide a complete universal named error-code catalog mapping every rejection (invalid size, market closed, invalid stop distance, duplicate request, etc.) to a stable API enum in one table. Codex must preserve raw response/status/reason data and avoid inventing undocumented Capital.com error names.

6. Source

Official Capital.com Public API: Orders and positions, Position/Order confirmation, Account activity history, endpoint response definitions.
