

Capital.com API - Costs, Commission, Funding & Slippage

Part 9 for CapitalDemoBroker / Codex

Source basis: official Capital.com Public API 1.0.0, accessed 10 Aug 2026. This is a Codex-oriented technical reference; unsupported behavior is explicitly marked as unresolved rather than guessed.

1. Spread

Current market data provides bid and offer (Ask). Historical candles provide bid and ask OHLC. Snapshot spread can therefore be observed as Ask - Bid, but the API section does not expose a separate universal spread-charge field.

2. Overnight funding metadata

Instrument market details expose overnight-fee metadata including longRate, shortRate and swapChargeTimestamp in the documented schema. This should be stored as broker metadata rather than replaced with a project constant when real-cost mode is enabled.

3. Commission evidence

Transaction history includes explicit transaction categories TRADE_COMMISSION and TRADE_COMMISSION_GSL, plus FX_COMMISSION, SWAP, CONVERSION and TRADE_SLIPPAGE_PROTECTION. These records are useful for post-trade reconciliation of actual costs.

The public Open API documentation reviewed does not provide a single universal pre-trade formula that guarantees the future close commission for every instrument, jurisdiction and account type.

4. Consequence for Scenario 1 cost prediction

INITIAL_LONG_CLOSE_COMMISSION and INITIAL_SHORT_CLOSE_COMMISSION cannot safely be derived from a made-up generic API formula. If the strategy requires exact predicted close commission before closure, obtain the official product/account-specific fee formula or treat the prediction as a configured estimate while reconciling actual TRADE_COMMISSION transactions afterward.

5. Slippage

Deal confirmation exposes execution level while market data provides the expected Bid/Ask snapshot that the adapter can capture immediately before submission. Store both expected quote and confirmed execution level.

The public API does not prescribe one universal bot-side slippage formula across market orders, stop orders, limit orders and potentially multiple affected deals. If multiple fills/deals are involved, use actual broker confirmation/history data instead of inventing one price.

6. Source

Official Capital.com Public API: Markets details, Deal confirmation and Account transactions history.
